

## Level 6 Hospital Edition

Equipment inventory, maintenance and calibration-certification software for Level 6 hospitals.

### 3 packages

KES 1M – 3M, one-time

### From KES 25K/yr

support, scoped to workload

### ISO/IEC 17025

calibration engine, Packages B & C

## About Cirqen Labs

Cirqen Labs is a software platform for hospital biomedical engineering departments. It covers equipment registration, maintenance scheduling, job cards and spare-parts tracking, and an audit trail of completed work. Its calibration engine follows ISO/IEC 17025 practice: decimal-precision tolerance and uncertainty-budget calculations, an independent-reviewer approval step, and certificate numbering that never repeats or skips, issued under the facility's own authority.

The Level 6 Edition is offered in three packages, so a Level 6 hospital can match spend to the capability — and the hardware — it actually needs.

## Choose Your Package

### A · Standard

**KES 1,000,000** one-time

Up to 2,000 equipment records · unlimited user accounts

- ✓ Equipment inventory, PPM scheduling, job cards & workshop, reporting, audit log
- ✓ Calibration due-date tracking with external certificate storage (no in-house issuance)
- ✓ Data migration of existing records, up to 2,000 items
- ✓ 2-day on-site staff training
- ✓ Go-live support through your first full maintenance cycle

Want the calibration engine later? Upgrade to Professional at any time for KES 1,600,000 plus the fee difference.

## B · Professional

**KES 2,500,000** one-time

Up to 3,000 equipment records · unlimited user accounts

- ✓ Everything in Standard
- ✓ Full in-house ISO/IEC 17025 calibration & certification engine: procedure definitions, tolerance/uncertainty calculations, independent-reviewer approval, gapless certificate numbering under your own facility's authority
- ✓ Data migration of existing records, up to 3,000 items
- ✓ 3-day on-site training, covering technologist, reviewer and calibration-workflow tracks separately

RECOMMENDED

## C · Turnkey

**KES 3,000,000** one-time

Same scope as Professional

- ✓ Everything in Professional
- ✓ 10 pre-configured laptops/workstations for your biomedical engineering department, deployed and ready from day one
- ✓ Priority onboarding across departments

Need more workstations later? Additional laptops are available at cost, approximately KES 65,000–90,000 each.

All three packages are a single, one-time purchase — no recurring licence fee.

**Every package includes a dedicated HQ server and full offline capability.** The system runs on infrastructure hosted at your facility, so day-to-day operation does not depend on an internet connection. If your facility does not have a dedicated server to host it on, or you would prefer we host it for you in the cloud, that hosting is not included in the base price — it is available as an additional service for KES 25,000/year.

# Which Package Is Best For You?

| Situation                                                                                                         | Best fit                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| No calibration lab, or calibration still fully outsourced                                                         | <b>A · Standard</b> — get the inventory/maintenance backbone in place now; add the calibration engine later once your lab is ready.      |
| Have an accredited (or accreditation-track) calibration lab, and IT already supplies adequate workstations        | <b>B · Professional</b> — full calibration capability without paying for hardware you don't need.                                        |
| Have or are building calibration capability, and biomedical engineering staff lack dedicated, modern workstations | <b>C · Turnkey (recommended default)</b> — the KES 500,000 gap over Professional is close to bulk cost for 10 business laptops in Kenya. |

**Our default recommendation is Package C** for most Level 6 facilities. Software and hardware procurement running on separate timelines is one of the most common reasons a system sits unused after go-live — bundling both removes that risk. Package B remains the better choice specifically where IT already has the hardware question solved.

## Annual Support & System Checks

The annual support fee is not a single fixed number across every hospital — it is scoped to your facility's actual workload and current situation, and confirmed with you during onboarding before anything is signed. The figures below are starting points, not final quotes.

| Package          | Starting from | Covers                                                                                                                  |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------|
| A · Standard     | KES 25,000/yr | Patches & security updates, remote support (business hours), one annual remote health check.                            |
| B · Professional | KES 45,000/yr | Everything in Standard, plus certificate-authority integrity checks and priority handling of calibration-engine issues. |
| C · Turnkey      | KES 45,000/yr | Same as Professional. Hardware carries its own manufacturer warranty, separate from this fee.                           |

What moves the fee up or down from the starting figure: equipment volume and how fast it changes, number of active users, expected support-ticket volume, and your current staffing and infrastructure situation. A facility with a smaller, stable equipment count and few users typically sits at the starting figure; a larger department with higher turnover or heavier support needs is assessed above it.

### Also included, every year:

- ✓ Unlimited user accounts — no per-seat fee
- ✓ Additional staff training sessions beyond what's included at purchase, at no extra charge

Larger one-off requests — a custom feature, a major version upgrade — are scoped and agreed with you directly rather than charged from a fixed price list. If your facility has no dedicated server, cloud hosting is available for KES 25,000/year.

## Terms & Next Steps

---

- **Payment:** 50% on signing, 50% on go-live. Annual support fee billed on the anniversary of go-live.
- **Implementation:** 4–6 weeks setup and configuration, running alongside data migration and training; Packages B/C run slightly longer to configure the calibration engine and reviewer/approver workflow.
- **Ownership:** one-time purchase — the hospital owns its deployment; the annual fee covers support and updates, not a usage licence.

## Frequently Asked Questions

---

### **Can we start with Standard and add the calibration engine later?**

Yes — see the upgrade path above. Your existing inventory, maintenance, and job-card data carries over unchanged.

### **Who owns the certificate-numbering authority in Packages B and C?**

Your facility does. Certificate numbers are minted under a single serialized authority hosted on your own infrastructure — no third party sits between your calibration record and your certificate.

### **What happens to the laptops after the warranty period (Package C)?**

They remain hospital property outright; the annual support fee covers the software only, hardware warranty is handled separately by the manufacturer/supplier.

### **Do we need to provide our own server?**

Every package includes a dedicated HQ server and full offline capability, run on infrastructure at your facility. If you don't have a server to host it on, or would rather we host it in the cloud, that's available as an add-on at KES 25,000/year instead.
